AB **Measles virus** was propagated in VERO cells and
purified from the culture supernatants by two successive
tartrate-density-gradient centrifugations. Surface carbohydrates were
labelled both in vitro and in vivo with ³H after treatment with galactose
oxidase/NaB³H₄ or with [³H]glucosamine. The major labelled glycoprotein
in measles virions had a mol.weight of 79 000. After labelling with
periodate/NaB³H₄, which would result in specific labelling of sialic acid
residues, the 79 000-mol.weight glycoprotein was very weakly labelled. This
suggests that there is no or a very low amount of sialic acid in the
virions. Further analysis of the glycoprotein showed that galactose is
the terminal carbohydrate unit in the **oligosaccharide**, and the
molecular weight of the glycopeptide obtained after Pronase digestion is
about 3000. The **oligosaccharide** is attached to the polypeptide
through an alkali-stable bond, indicating a N-glycosidic asparagine
linkage.
